

FEATURES

- Central cloud based management
- Allow teachers to push apps
- Track installed apps including apps by age rating
- Inventory management for devices
- Inventory management for Apple VPP purchases
- Dynamic device location based maps
- Manage device and app access
- Filter Apple App store access
- Centrally push apps by group membership
- Remotely wipe devices
- Time and location based policies
- Wi-Fi management
- Apple VPP integration with purchase inventory tools
- Integration with iboss Security Filters for AUP enforcement
- Device tampering detection and alerting
- Student Information System integration with GoLiveCampus
- iOS including Snow Leopard Support Detect unauthorized apps

Education focused mobile device management:

Manage compliance, save time, and expand learning

Mobile devices in education streamline communication and expand learning between teachers, staff, and students. With the expansion of mobile devices in schools, the need for central management is growing in order to manage policies, track inventory, filter what apps can be installed, and insure teachers have access to the devices full potential.

iboss Mobile Device Management provides education specific tools to not only secure the devices but expand learning. Utilizing the iboss GoLiveCampus feature set along with integration with iTunes University, iboss MDM creates a robust learning environment that goes beyond standard device management. Advanced features allowing teachers to push apps to students ensures teachers have access to the content they need to insure uninterrupted learning.

Easily Enroll Devices With just Two Steps

iboss MDM Advantages:

Manage device locations: Visually identify where devices are physically located

Allow teachers to push apps: Insure instruction continues uninterrupted

Simple policy management: Group based policies structures

Directory Integration: Local directory authentication without on premise hardware

Manage device settings: Centrally update device settings such as camera, wifi by group

Inventory VPP Purchases: Manage Apple volume purchase (VPP) inventory reducing time and money

Restrict Access to Apps Store: Insure only apps aligned with the AUP are accessed

Powerful Reporting: Provides central overview of installed apps by age rating, physical device location, configuration, policies, and AUP violations

Integrate with iboss Filters: Enforce polices for safe web access while surfing on Safari's browser

Streamlined Setup: SaaS cloud based solution. No hardware required. Set up devices on or off premise

Time and money are factors

Avoid the complications of setting up servers or spending days configuring devices, iboss MDM was designed with education in mind providing a cloud based system which does not require any hardware onsite. Additionally, its simple 2 set setup allows configuration of devices even if they are not on site. Remote devices are identified and automatically redirected for installation. Quick setup, minimal cost investment.

Uninterrupted instruction

Insuring fluid instruction minimizes distractions and frustration in the classroom. To achieve this, teachers can be provided tools to manage apps they find of value for their students without having to wait for approval. In addition, collaboration with Golivecampus and the integration of iTunes University with iboss MDM provides tools to share resources, discussion, videos and other learning material right in the classroom, uninterrupted.

More inventory, less time

A reality in education technology is the growth of more devices and programs designed to expand education but restricted staffing to manage these new products due to budget restraints. Devices such as iPads not only introduce a need to manage physical device inventory but also software such as apps purchased for the district devices through the Apple Volume Purchasing Program (VPP). Going beyond physical device inventory, iboss MDM manages apps purchased through VPP insuring each license utilized. Licenses on lost or damaged devices can be identified minimizing cost and reducing waste.

Reports take center stage

A key factor in managing devices and apps is identifying where they are and what's on them. Expanding general MDM reporting, iboss MDM focuses on information you need to quickly resolve threats or compromised devices. Advanced reporting includes Dynamic Geomapping Devices to identify physically where each device is currently located over a live map and track lost/stolen devices quickly. Global app dashboard provides instant information on how many apps are installed on devices, apps by category, apps by age rating, and VPP purchased licensing. This insures any unauthorized apps are quickly identified while also managing physical and software inventory. Reports designed to identify the information you need when you need it.

Great apps..and some undesired

Simple access to apps for education, instruction, and productivity is essential. Unfortunately, this also opens general access to the app stores undesired apps. Managing what apps can be accessed is critical for smooth deployments as well as insure compliance with the AUP and CIPA. Iboss MDM allows administrators to filter what apps are accessible and those restricted by group membership providing security without compromise.

CIPA compliance, on or off premise

Seamless integration with iboss SWG Filters creates central Internet access policy management and reporting whether devices are on or off premise. Information on all Internet traffic including violations to the AUP are logged and managed through the iboss SWG filter providing detailed reporting for auditing, compliance and threat detection. Iboss MDM integrates into the full suite of iboss SWG products securing networks on or off premise.

iboss MDM manages access to the app store by category, age rating, etc. Increasing flexibility when managing apps to all devices.

The iboss Suite

Choose an All-in-one solution, or customize it to your networks needs.

- iboss SWG Web Filter
- iboss SWG IPS/IDS/Threat
- iboss SWG Firewall
- Mobile Security
- Mobile Device Management
- Email Spam Boss
- Email Archiver
- Activity & Threat Reporter
- iboss Pro

About iboss Security, a division of Phantom Technologies Inc.

Founded in 2003, Phantom Technologies, Inc is a global provider of network security solutions. Its iboss Security line provides educational focused solutions for network security. Proprietary engineering secures high demand network for web content management, intrusion, mobile device security and management, and email security.

Security and Reporting

Security and information is key in insuring proper management and CIPA compliance for these devices. Our advanced reporting tools create one of a kind live threat panel to provide detailed insight on device locations over a live global map. Drill down reporting provides information on installed apps by age rating, inventory, and users.
